Continuation of 11. does NOT place the application in condition for allowance because: Applicant argues that the prior art of Koai et al (US 6,159,299) does not anticipate the present invention, however Koai et al teaches a purge ring 280 and an edge ring assembly comprising a top, middle, and botttom ring, see Fig. 2B Col. 5 lines 22-30 recite that the rings are in mating engagement in that the purge ring (first edge ring) has at least one tapered recess to mate with the centering bolt (tapered pin) of the edge ring assembly (second edge ring). Applicant does not exclude an edge ring that is constructed as a composite of additional rings Additionally the edge ring assembly functions as a purge ring according to the abstract and the top and middle rings are both in mating engagement with the bottom ring which provides the centering bolt (pin). The prior art by Cheng et al teaches a shield ring 50 (first edge ring) which is taught to be a purge ring in col. 8 lines 25-58 and is provided with at least one tapered recess Cheng further teaches a shield support means 70 (second edge ring) which is provided with a pin and mates with first edge ring. Note the shied support means 70 of Cheng meets the structural limitations of the claim. Regarding the argument that the first edge ring of Cheng does not meet the limitation of being disposed on the support means, the support means of Cheng is provided with a susceptor lift 46, when the support is lifted in the upright position this claim is satisified and thus the first edge ring 50 of Cheng inherently capable of meeting this process limitatin as it comprises the structure (a support lift) to fulfill this function. Whether or not the shadow ring (second edge ring) of Cheng overhanging the second surface of the substrate is a matter of an intended use and depends on the type/size of substrate used. The examiner recommends that applicant claim the structure of the shadow ring that would meet this limitation despite the substrate.
